ABSTRACTED-PUB-NO: RU 2020891C

BASIC-ABSTRACT: The apparatus, for use in traumatology and orthopaedics, consists of adjustable supports (1,2,12) connected to a distractor (3) in the form of a telescopic bar. One of the supports has a cradle (8) which can be set at an adjustable angle for the thigh, the second has a clamp (16) and holder (18) for the lower leg, and the third a fixing (20) for the foot.

The foot fixing is in the form of an adjustable bracket on the top of its support, while the lower leg holder is fitted to the distractor by a coupling

(17) which allows it to be moved lengthwise and rotated.
The first and third
supports are connected to the distractor by pivots (7)
which allow them to be
adjusted within the plane of the supports, and the thigh
cradle has fixing
steps (9) with buckles.

ADVANTAGE - Enables leg bones to be repositioned with great
accuracy in
hospital and field conditions, is simple to manufacture and
use. Bul.
